

**The Pinouts Book** was created for designers and engineers as a quick reference for remembering the functions of all the different pinouts in your electronics projects.

The book covers a range of commonly used components, such as connectors, single board computers, dev boards, microcontroller chips, modules and more.

More technical information for each component is available by going to the "[pinouts.org/XXX](#)" URLs at the top of the pages. These each redirect to official datasheets or specifications.

For more info, visit [pinouts.org](#)

Happy building :)  
*NODE & Baptiste*

\*Pin can be used as input or output. As input, supply 3.6 - 5.5VDC. When the Photon is powered by USB, this pin outputs ~4.8VDC at max 1A load. \*\*3.3VDC regulated output at max 100mA load. Can also be used to power the Photon instead of VIN / USB. \*\*\*Supply to the internal RTC, backup registers and SRAM when 3V3 is not present (1.65 to 3.6VDC).

NOTE: All I/O pins have a 90k pull-down resistor inside the iMX8M SoC that is used by default during bootup, except for the I2C pins, which instead have a pull-up to 3.3V on the SoM. Do not connect a device that draws more than ~ 82 mA of power or you will brownout the system.

NOTE 1: Ports B & D are 8-bit bi-directional I/O ports with internal pull-up resistors (selected for each bit). As inputs ,Ports B & D pins that are externally pulled low will source current if the pull-up resistors are activated. Refer to the datasheet for alternate functions of Ports B & D.

NOTE 2: Port C is a 7-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). As inputs ,Port C pins that are externally pulled low will source current if the pull-up resistors are activated. Refer to the datasheet for alternate functions of Port C.

NOTE 3: AVCC is the supply voltage pin for the A/D Converter, PC3:0 and ADC7:6. It should be externally connected to VCC even if ADC is not used.
